Foreword

[General part to be provided by ISO CS]

This technical report specifies an extension to the module program unit facilities of the programming language Fortran. Fortran is specified by the international standard ISO/IEC 1539-1:2004. This document has been prepared by ISO/IEC JTC1/SC22/WG5, the technical working group for the Fortran language.

It is the intention of ISO/IEC JTC1/SC22/WG5 that the semantics and syntax specified by this technical report be included in the next revision of the Fortran standard (ISO/IEC 1539-1:2004) without change unless experience in the implementation and use of this feature identifies errors that need to be corrected, or changes are needed to achieve proper integration, in which case every reasonable effort will be made to minimize the impact of such changes on existing implementations.

0 Introduction

The module system of Fortran, as standardized by ISO/IEC 1539-1:2004, while adequate for programs of modest size, has shortcomings that become evident when used for large programs, or programs having large modules. The primary cause of these shortcomings is that modules are monolithic.

This technical report extends the module facility of Fortran so that program developers can optionally encapsulate the implementation details of module procedures in **submodules** that are separate from but dependent on the module in which the interfaces of their procedures are defined. If a module or submodule has submodules, it is the **parent** of those submodules.

The facility specified by this technical report is compatible to the module facility of Fortran as standardized by ISO/IEC 1539-1:2004.

0.1 Shortcomings of Fortran's module system

The shortcomings of the module system of Fortran, as specified by ISO/IEC 1539-1:2004, and solutions offered by this technical report, are as follows.

0.1.1 Decomposing large and interconnected facilities

If an intellectual concept is large and internally interconnected, it requires a large module to implement it. Decomposing such a concept into components of tractable size using modules as specified by ISO/IEC 1539-1:2004 may require one to convert private data to public data. The drawback of this is not primarily that an “unauthorized” procedure or module might access or change these entities, or develop a dependence on their internal details. Rather, during maintenance, one must then answer the question “where is this entity used?”

Using facilities specified in this technical report, such a concept can be decomposed into modules and submodules of tractable size, without exposing private entities to uncontrolled use.

Decomposing a complicated intellectual concept may furthermore require circularly dependent modules, but this is prohibited by ISO/IEC 1539-1:2004. It is frequently the case, however, that the dependence is between the implementation of some parts of the concept and the interface of other parts. Because the module facility defined by ISO/IEC 1539-1:2004 does not distinguish between the implementation and interface, this distinction cannot be exploited to break the circular dependence. Therefore, modules that implement large intellectual concepts tend to become large, and therefore expensive to maintain reliably.

Using facilities specified in this technical report, complicated concepts can be implemented in submodules that access modules, rather than modules that access modules, thus reducing the possibility for circular dependence between modules.

0.1.2 Avoiding recompilation cascades

Once the design of a program is stable, few changes to a module occur in its **interface**, that is, in its public data, public types, the interfaces of its public procedures, and private entities that affect their definitions. We refer to the rest of a module, that is, private entities that do not affect the definitions of public entities, and the bodies of its public procedures, as its **implementation**. Changes in the implementation have no effect on the translation of other program units that access the module. The existing module facility, however, draws no structural distinction between the interface and the implementation. Therefore, if one changes any part of a module, most language translation systems have no alternative but to conclude that a change might have occurred that could affect other modules that access the changed module. This effect cascades into modules that access modules that access the changed module, and so on. This can cause a substantial expense to retranslate and recertify a large program. Recertification can be several orders of magnitude more costly than retranslation.

Using facilities specified in this technical report, implementation details of a module can be encapsulated in submodules. Submodules are not accessible by use association, and they depend on their parent module, not vice-versa. Therefore, submodules can be changed without implying that a program unit accessing the parent module (directly or indirectly) must be retranslated.

It may also be appropriate to replace a set of modules by a set of submodules each of which has access to others of the set through the parent/child relationship instead of USE association. A change in one such submodule requires the retranslation only of its descendant submodules. Thus, compilation and certification cascades caused by changes can be shortened.

0.1.3 Packaging proprietary software

If a module as specified by international standard ISO/IEC 1539-1:2004 is used to package proprietary software, the source text of the module cannot be published as authoritative documentation of the interface of the module, without either exposing trade secrets, or requiring the expense of separating the implementation from the interface every time a revision is published.

Using facilities specified in this technical report, one can easily publish the source text of the module as authoritative documentation of its interface, while withholding publication of the source text of the submodules that contain the implementation details, and the trade secrets embodied within them.

0.1.4 Easier library creation

Most Fortran translator systems produce a single file of computer instructions and data, frequently called an *object file*, for each module. This is easier than producing an object file for the specification part and one for each module procedure. It is also convenient, and conserves space and time, when a program uses all or most of the procedures in each module. It is inconvenient, and results in a larger program, when only a few of the procedures in a general purpose module are needed in a particular program.

Modules can be decomposed using facilities specified in this technical report so that it is easier for each program unit's author to control how module procedures are allocated among object files. One can then collect sets of object files that correspond to a module and its submodules into a library.

0.2 Disadvantage of using this facility

Translator systems will find it more difficult to carry out global inter-procedural optimizations if the program uses the facility specified in this technical report. Interprocedural optimizations involving

procedures in the same module or submodule will not be affected. When translator systems become able to do global inter-procedural optimization in the presence of this facility, it is possible that requesting inter-procedural optimization will cause compilation cascades in the first situation mentioned in subclause 0.1.2, even if this facility is used. Although one advantage of this facility could perhaps be reduced in the case when users request inter-procedural optimization, it would remain if users do not request inter-procedural optimization, and the other advantages remain in any case.

Information technology – Programming Languages – Fortran

Technical Report: Enhanced Module Facilities

1 General

1 1.1 Scope

2 This technical report specifies an extension to the module facilities of the programming language Fortran. The Fortran language is specified by international standard ISO/IEC 1539-1:2004 : Fortran. The extension allows program authors to develop the implementation details of concepts in new program units, called **submodules**, that cannot be accessed directly by use association. In order to support submodules, the module facility of international standard ISO/IEC 1539-1:2004 is changed by this technical report in such a way as to be upwardly compatible with the module facility specified by international standard ISO/IEC 1539-1:2004.

9 Clause 2 of this technical report contains a general and informal but precise description of the extended functionalities. Clause 3 contains detailed instructions for editorial changes to ISO/IEC 1539-1:2004.

11 1.2 Normative References

12 The following standards contain provisions that, through reference in this text, constitute provisions of this technical report. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. Parties to agreements based on this technical report are, however, encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referenced applies. Members of IEC and ISO maintain registers of currently valid International Standards.

18 ISO/IEC 1539-1:2004 : *Information technology – Programming Languages – Fortran; Part 1: Base Language*
19

2 Requirements

The following subclauses contain a general description of the extensions to the syntax and semantics of the Fortran programming language to provide facilities for submodules, and to separate subprograms into interface and implementation parts.

2.1 Summary

This technical report defines a new entity and modifications of two existing entities.

The new entity is a program unit, the *submodule*. As its name implies, a submodule is logically part of a module, and it depends on that module. A new variety of interface body, a *module procedure interface body*, and a new variety of procedure, a *separate module procedure*, are introduced.

By putting a module procedure interface body in a module and its corresponding separate module procedure in a submodule, program units that access the interface body by use association do not depend on the procedure's body. Rather, the procedure's body depends on its interface body.

2.2 Submodules

A **submodule** is a program unit that is dependent on and subsidiary to a module or another submodule. A module or submodule may have several subsidiary submodules. If it has subsidiary submodules, it is the **parent** of those subsidiary submodules, and each of those submodules is a **child** of its parent. A submodule accesses its parent by host association.

An **ancestor** of a submodule is its parent, or an ancestor of its parent. A **descendant** of a module or submodule is one of its children, or a descendant of one of its children.

A submodule is introduced by a statement of the form `SUBMODULE (parent-identifier) submodule-name`, and terminated by a statement of the form `END SUBMODULE submodule-name`. The *parent-identifier* is either the name of the parent module or is of the form `ancestor-module-name : submodule-name`, where *submodule-name* is the name of a submodule that is a descendant of the module named *ancestor-module-name*.

Identifiers declared in a submodule are effectively PRIVATE, except for the names of separate module procedures that correspond to public module procedure interface bodies (2.3) in the ancestor module. It is not possible to access entities declared in the specification part of a submodule by use association because a USE statement is required to specify a module, not a submodule. ISO/IEC 1539-1:2004 permits PRIVATE and PUBLIC declarations only in a module, and this technical report does not propose to change this.

Submodule identifiers are global identifiers, but since they consist of a module name and a descendant submodule name, the name of a submodule can be the same as the name of another submodule so long as they do not have the same ancestor module.

In all other respects, a submodule is identical to a module.

2.3 Separate module procedure and its corresponding interface body

A **module procedure interface body** specifies the interface for a separate module procedure. It is different from an interface body defined by ISO/IEC 1539-1:2004 in three respects. First, it is introduced by a *function-stmt* or *subroutine-stmt* that includes MODULE in its *prefix*. Second, it specifies that its corresponding procedure body is in the module or submodule in which it appears, or one of its descendant submodules. Third, it accesses the module or submodule in which it is declared by host association.

1 A **separate module procedure** is a module procedure whose interface is declared in the same module or
 2 submodule, or is declared in one of its ancestors and is accessible from that ancestor by host association.
 3 The module subprogram that defines it may redeclare its characteristics, whether it is recursive, and its
 4 binding label. If any of these are redeclared, the characteristics, corresponding dummy argument names,
 5 whether it is recursive, and its binding label if any, shall be the same as in its module procedure interface
 6 body. The procedure is accessible by use association if and only if its interface body is accessible by
 7 use association. It is accessible by host association if and only if its interface body or procedure body is
 8 accessible by host association.

9 If the procedure is a function and its characteristics are not redeclared, the result variable name is
 10 determined by the FUNCTION statement in the module procedure interface body. Otherwise, the
 11 result variable name is determined by the FUNCTION statement in the module subprogram.

12 2.4 Examples of modules with submodules

13 The example module POINTS below declares a type POINT and a module procedure interface body for
 14 a module function POINT_DIST. Because the interface body includes the MODULE prefix, it accesses
 15 the scoping unit of the module by host association, without needing an IMPORT statement; indeed, an
 16 IMPORT statement is prohibited.

```

17     MODULE POINTS
18         TYPE :: POINT
19             REAL :: X, Y
20         END TYPE POINT
21
22         INTERFACE
23             MODULE FUNCTION POINT_DIST ( A, B ) RESULT ( DISTANCE )
24                 TYPE(POINT), INTENT(IN) :: A, B ! POINT is accessed by host association
25                 REAL :: DISTANCE
26             END FUNCTION POINT_DIST
27         END INTERFACE
28     END MODULE POINTS
  
```

29 The example submodule POINTS_A below is a submodule of the POINTS module. The type POINT and
 30 the interface POINT_DIST are accessible in the submodule by host association. The characteristics of the
 31 function POINT_DIST are redeclared in the module function body, and the dummy arguments have the
 32 same names. The function POINT_DIST is accessible by use association because its module procedure
 33 interface body is in the ancestor module and has the PUBLIC attribute.

```

34     SUBMODULE ( POINTS ) POINTS_A
35         CONTAINS
36             REAL MODULE FUNCTION POINT_DIST ( A, B ) RESULT ( DISTANCE )
37                 TYPE(POINT), INTENT(IN) :: A, B
38                 DISTANCE = SQRT( (A%X-B%X)**2 + (A%Y-B%Y)**2 )
39             END FUNCTION POINT_DIST
40     END SUBMODULE POINTS_A
  
```

41 An alternative declaration of the example submodule POINTS_A shows that it is not necessary to
 42 redeclare the properties of the module procedure POINT_DIST.

```

43     SUBMODULE ( POINTS ) POINTS_A
  
```

```
1     CONTAINS
2     MODULE PROCEDURE POINT_DIST
3         DISTANCE = SQRT( (A%X-B%X)**2 + (A%Y-B%Y)**2 )
4     END PROCEDURE POINT_DIST
5     END SUBMODULE POINTS_A
```

1	[In the first line of the second paragraph of 2.4.3.1.1 insert “, submodule,” after “module”.]	17:4
2	[At the end of 3.3.1, immediately before 3.3.1.1, add “END PROCEDURE” and “END SUBMODULE”	28
3	into the list of adjacent keywords where blanks are optional, in alphabetical order.]	
4	[In the second line of the third paragraph of 4.5.1.1 after “definition” insert “, and its descendant	46:10
5	submodules”.]	
6	[In the last line of Note 4.18, after “defined” add “, and its descendant submodules”.]	46
7	[In the last line of the fourth paragraph of 4.5.3.6, after “definition”, add “and its descendant submod-	55:10
8	ules”.]	
9	[In the last line of Note 4.40, after “module” add “, and its descendant submodules”.]	55
10	[In the last line of Note 4.41, after “definition” add “and its descendant submodules”.]	56
11	[In the last line of the paragraph before Note 4.44, after “definition” add “, and its descendant submod-	58:8
12	ules”.]	
13	[In the third and fourth lines of the second paragraph of 4.5.5.2 insert “or submodule” after “module”	59:23-24
14	twice.]	
15	[In the second paragraph of Note 4.48, insert “or submodule” after “module” twice.]	60
16	[In the first line of the second paragraph of 5.1.2.12 insert “, or any of its descendant submodules” after	84:3
17	“attribute”.]	
18	[In the first and third lines of the second paragraph of 5.1.2.13 insert “or submodule” after “module”	84:14,16
19	twice.]	
20	[In the third line of the penultimate paragraph of 6.3.1.1 replace “or a subobject thereof” by “or sub-	113:18
21	module, or a subobject thereof”.]	
22	[In the first two lines of the first paragraph after Note 6.23 insert “or submodule” after “module” twice.]	115:9-10
23	[In the second line of the first paragraph of Section 11 insert “, a submodule” after “module”.]	249:3
24	[In the first line of the second paragraph of Section 11 insert “, submodules” after “modules”.]	249:4
25	[Add another alternative to R1108]	250:17+
26	or <i>separate-module-subprogram</i>	
27	[Within the first paragraph of 11.2.1, at its end, insert the following sentence:]	251:8
28	A submodule shall not reference its ancestor module by use association, either directly or indirectly.	
29	[Then insert the following note:]	

NOTE 11.6¹₃

It is possible for submodules with different ancestor modules to access each others' ancestor modules by use association.

1 [After constraint C1109 insert an additional constraint:] 251:30+

2 C1109a (R1109) If the USE statement appears within a submodule, *module-name* shall not be the name

3 of the ancestor module of that submodule (11.2.2).

4 [Insert a new subclass immediately before 11.3:] 253:6-

5 **11.2.2 Submodules**

6 A **submodule** is a program unit that extends a module or another submodule. The program unit

7 that it extends is its **parent**; its parent is specified by the *parent-identifier* in the *submodule-stmt*. A

8 submodule is a **child** of its parent. An **ancestor** of a submodule is its parent or an ancestor of its parent.

9 A **descendant** of a module or submodule is one of its children or a descendant of one of its children.

10 The **submodule identifier** consists of the ancestor module name together with the submodule name.

NOTE 11.6²₃

A submodule has exactly one ancestor module and may optionally have one or more ancestor submodules.

11 A submodule accesses the scoping unit of its parent by host association.

12 A submodule may provide implementations for module procedures, each of which is declared by a module

13 procedure interface body (12.3.2.1) within that submodule or one of its ancestors, and declarations and

14 definitions of other entities that are accessible by host association in descendant submodules.

15 R1115a *submodule* **is** *submodule-stmt*

16 [*specification-part*]

17 [*module-subprogram-part*]

18 *end-submodule-stmt*

19 R1115b *submodule-stmt* **is** SUBMODULE (*parent-identifier*) *submodule-name*

20 R1115c *parent-identifier* **is** *module-name*

21 **or** *submodule-identifier*

22 R1115d *submodule-identifier* **is** *ancestor-module-name* : *submodule-name*

23 R1115e *end-submodule-stmt* **is** END [SUBMODULE [*submodule-name*]]

24 C1114a (R1115c) The *module-name* shall be the name of a nonintrinsic module.

25 C1114b (R1115d) The *ancestor-module-name* shall be the name of a nonintrinsic module; the *submodule-*

26 *name* shall be the name of a descendant of that module.

27 C1114c (R1115a) An automatic object shall not appear in the *specification-part* of a submodule.

28 C1114d (R1115a) A submodule *specification-part* shall not contain a *format-stmt* or a *stmt-function-stmt*.

29 C1114e (R1115a) If an object of a type for which *component-initialization* is specified (R444) is declared

30 in the *specification-part* of a submodule and does not have the ALLOCATABLE or POINTER

- 1 attribute, the object shall have the SAVE attribute.
- 2 C1114f (R1115e) If a *submodule-name* is specified in the *end-submodule-stmt*, it shall be identical to the
3 *submodule-name* specified in the *submodule-stmt*.
-
- 4 [In the last line of the first paragraph of 12.3 after “units” add “, except that for a separate module 257:13
5 procedure body (12.5.2.4), the dummy argument names, binding label, and whether it is recursive shall
6 be the same as in its corresponding module procedure interface body (12.3.2.1)].
-
- 7 [In C1210 insert “that is not a module procedure interface body” after “*interface-body*”.] 259:20
-
- 8 [After the third paragraph after constraint C1211 insert the following paragraphs and constraints.] 259:30+
- 9 A **module procedure interface body** is an interface body in which the *prefix* of the initial *function-*
10 *stmt* or *subroutine-stmt* includes MODULE. It declares the interface for a separate module procedure
11 (12.5.2.4). A separate module procedure is accessible by use association if and only if its interface body
12 is declared in the specification part of a module and its name has the PUBLIC attribute. If its separate
13 module procedure body is not defined, the interface may be used to specify an explicit specific interface
14 but the procedure shall not be used in any way.
- 15 A **module procedure interface** is declared by a module procedure interface body.
- 16 C1211a (R1205) A scoping unit in which a module procedure interface body is declared shall be a module
17 or submodule.
- 18 C1212b (R1205) A module procedure interface body shall not appear in an abstract interface block.
-
- 19 [Add a right-hand-side to R1228:] 280:3+
- 20 **or** MODULE
-
- 21 [Add constraints after C1242:] 280:7+
- 22 C1242a (R1227) MODULE shall appear only within the *function-stmt* or *subroutine-stmt* of an interface
23 body that is declared in the scoping unit of a module or submodule, or of a module subprogram.
-
- 24 C1242b (R1227) If MODULE appears within the *prefix* in a module subprogram, a module procedure
25 interface having the same name as the subprogram shall be declared in the module or submodule
26 in which the subprogram is defined, or shall be declared in an ancestor of that program unit
27 and be accessible by host association from that ancestor.
- 28 C1242c (R1227) If MODULE appears within the *prefix* in a module subprogram, the subprogram shall
29 specify the same characteristics as its corresponding (12.5.2.4) module procedure interface body.
- 30 C1242d (R1227) If MODULE appears within the *prefix* in a module subprogram and a binding label
31 is specified, it shall be the same as the binding label specified in the corresponding module
32 procedure interface body.
- 33 C1242e (R1227) If MODULE appears within the *prefix* in a module subprogram, RECURSIVE shall
34 appear if and only if RECURSIVE appears in the *prefix* in the corresponding module procedure
35 interface body.
-
- 36 [Insert the following new subclass before the existing subclass 12.5.2.4 and renumber succeeding 283:1-
37 subclasses appropriately:]

38 **12.5.2.4 Separate module procedures**

1 A **separate module procedure** is a module procedure defined by a *separate-module-subprogram*,
 2 by a *function-subprogram* in which the *prefix* of the initial *function-stmt* includes MODULE, or by a
 3 *subroutine-subprogram* in which the prefix of the initial *subroutine-stmt* includes MODULE. Its interface
 4 is declared by a module procedure interface body (12.3.2.1) in the *specification-part* of the module or
 5 submodule in which the procedure is defined, or in an ancestor module or submodule.

6 R1234a *separate-module-subprogram* is MODULE PROCEDURE *procedure-name*
 7 [*specification-part*]
 8 [*execution-part*]
 9 [*internal-subprogram-part*]
 10 *end-sep-subprogram-stmt*

11 R1234b *end-sep-subprogram-stmt* is END [PROCEDURE [*procedure-name*]]

12 C1251a (R1234a) The *procedure-name* shall be the same as the name of a module procedure interface
 13 that is declared in the module or submodule in which the *separate-module-subprogram* is defined,
 14 or is declared in an ancestor of that program unit and is accessible by host association from that
 15 ancestor.

16 C1251b (R1234b) If a *procedure-name* appears in the *end-sep-subprogram-stmt*, it shall be identical to
 17 the *procedure-name* in the MODULE PROCEDURE statement.

18 A module procedure interface body and a subprogram that defines a separate module procedure **corre-**
 19 **spond** if they have the same name, and the module procedure interface is declared in the same program
 20 unit as the separate module procedure or is declared in an ancestor of the program unit in which the
 21 separate module procedure is defined and is accessible by host association from that ancestor.

NOTE 12.40¹/₂

A separate module procedure can be accessed by use association if and only if its interface body is declared in the specification part of a module and its name has the PUBLIC attribute. A separate module procedure that is not accessible by use association might still be accessible by way of a procedure pointer, a dummy procedure, or a type-bound procedure.

22 If a procedure is defined by a *separate-module-subprogram*, its characteristics are specified by the corre-
 23 sponding module procedure interface body.

24 If a separate module procedure is a function defined by a *separate-module-subprogram*, the result variable
 25 name is determined by the FUNCTION statement in the module procedure interface body. Otherwise,
 26 the result variable name is determined by the FUNCTION statement in the module subprogram.

27 [In constraint C1253 replace “*module-subprogram*” by “a *module-subprogram* that does not define a
 28 separate module procedure”.] 283:7

29 [In the first line of the first paragraph after syntax rule R1237 in 12.5.2.6 insert “, submodule” after
 30 “module”,] 284:37

31 [In the list in subclause 16.0, add an item after item (1):] 405:9+

32 (1¹/₂) A submodule identifier (12.5.2.4),

33 [In the second sentence of the first paragraph of 16.1, insert “non-submodule” before “program unit.”] 405:19,22

34 [After the second sentence of the first paragraph of 16.1, insert a new sentence “The submodule identifier
 35 is a global identifier and shall not be the same as any other submodule identifier.”] 405:22

NOTE 16.2¹/₂

406:1-

Submodule identifiers are global identifiers, but since they consist of a module name and a descendant submodule name, the name of a submodule can be the same as the name of another submodule so long as they do not have the same ancestor module.

1 [In item (1) in the first numbered list in 16.2, after “abstract interfaces” insert “, module procedure 406:6
2 interfaces”.]

3 [In the paragraph immediately before Note 16.3, after “(4.5.9)” insert “, and a separate module procedure 406:20
4 shall have the same name as its corresponding module procedure interface body”.]

5 [In the first line of the first paragraph of 16.4.1.3 insert “, a module procedure interface body” after 411:2,3
6 “module subprogram”. In the second line, insert “that is not a module procedure interface body” after
7 “interface body”.]

8 [In the third line of the first paragraph of 16.4.1.3, after the second instance of “interface body”, insert 411:4
9 a new sentence: “A submodule has access to the named entities of its parent by host association.”]

10 [In the third line after the sixteen-item list in 16.4.1.3 insert “that does not define a separate module 411:33
11 procedure” after the first “subprogram”.]

12 [In the first line of Note 16.9, after “interface body” insert “that is not a module procedure interface 412:1+2
13 body”.]

14 [Insert a new item after item (5)(d) in the list in 16.4.2.1.3:] 415:15+

15 (d¹/₂) Is in the scoping unit of a submodule if any scoping unit in that submodule or any of its
16 descendant submodules is in execution.

17 [In item (3)(c) of 16.5.6 insert “or submodule” after “module” twice.] 422:14-15

18 [Replace Note 16.18 by the following.] 422

NOTE 16.18

A module subprogram inherently references the module or submodule that is its host. Therefore, for processors that keep track of when modules or submodules are in use, one is in use whenever any procedure in it or any of its descendant submodules is active, even if no other active scoping units reference its ancestor module; this situation can arise if a module procedure is invoked via a procedure pointer, a type-bound procedure, or by means other than Fortran.

19 [In item (3)(d) of 16.5.6 insert “or submodule” after “module” twice.] 422:16-17

20 [Insert the following definitions into the glossary in alphabetical order:]

21 **ancestor** (11.2.2) : Of a submodule, its parent or an ancestor of its parent. 425:15+

22 **child** (11.2.2) : A submodule is a child of its parent. 426:43+

23 **correspond** (12.5.2.4) : A module procedure interface body and a subprogram that defines a separate 426:29+
24 module procedure correspond if they have the same name, and the module procedure interface is declared
25 in the same program unit as the separate module procedure or is declared in an ancestor of the program

- 1 unit in which the separate module procedure is defined and is accessible by host association from that
 2 ancestor.
- 3 **descendant** (11.2.2) : Of a module or submodule, one of its children or a descendant of one of its 428:28+
 4 children.
- 5 **module procedure interface** (12.3.2.1) : An interface defined by an interface body in which MODULE 432:9+
 6 appears in the *prefix* of the initial *function-stmt* or *subroutine-stmt*. It declares the interface for a separate
 7 module procedure.
- 8 **parent** (11.2.2) : Of a submodule, the module or submodule specified by the *parent-identifier* in its 432:36+
 9 *submodule-stmt*.
- 10 **separate module procedure** (12.5.2.4) : A module procedure defined by a subprogram in which 434:26+
 11 MODULE appears in the *prefix* of the initial *function-stmt* or *subroutine-stmt*.
- 12 **submodule** (2.2.5, 11.2.2) : A program unit that depends on a module or another submodule; it extends 435:15+
 13 the program unit on which it depends.
- 14 **submodule identifier** (11.2.2) : identifier of a submodule, consisting of the ancestor module name
 15 together with the submodule name.
-
- 16 [Insert a new subclause immediately before C.9:] 477:29+

17 **C.8.3.9 Modules with submodules**

18 Each submodule specifies that it is the child of exactly one parent module or submodule. Therefore, a
 19 module and all of its descendant submodules stand in a tree-like relationship one to another.

20 If a module procedure interface body that is specified in a module has public accessibility, and its
 21 corresponding separate module procedure is defined in a descendant of that module, the procedure can
 22 be accessed by use association. No other entity in a submodule can be accessed by use association. Each
 23 program unit that accesses a module by use association depends on it, and each submodule depends on
 24 its ancestor module. Therefore, if one changes a separate module procedure body in a submodule but
 25 does not change its corresponding module procedure interface, a tool for automatic program translation
 26 would not need to reprocess program units that access the module by use association. This is so even if
 27 the tool exploits the relative modification times of files as opposed to comparing the result of translating
 28 the module to the result of a previous translation.

29 This is not the end of the story. By constructing taller trees, one can put entities at intermediate levels
 30 that are shared by submodules at lower levels; changing these entities cannot change the interpretation of
 31 anything that is accessible from the module by use association. Developers of modules that embody large
 32 complicated concepts can exploit this possibility to organize components of the concept into submodules,
 33 while preserving the privacy of entities that are shared by the submodules and that ought not to be
 34 exposed to users of the module. Putting these shared entities at an intermediate level also prevents
 35 cascades of reprocessing and testing if some of them are changed.

36 The following example illustrates a module, `color_points`, with a submodule, `color_points_a`, that in
 37 turn has a submodule, `color_points_b`. Public entities declared within `color_points` can be accessed by
 38 use association. The submodules `color_points_a` and `color_points_b` can be changed without causing
 39 the appearance that the module `color_points` might have changed.

40 The module `color_points` does not have a *contains-part*, but a *contains-part* is not prohibited. The
 41 module could be published as definitive specification of the interface, without revealing trade secrets
 42 contained within `color_points_a` or `color_points_b`. Of course, a similar module without the `module`
 43 prefix in the interface bodies would serve equally well as documentation – but the procedures would be

1 external procedures. It would make little difference to the consumer, but the developer would forfeit all
 2 of the advantages of modules.

```

3  module color_points
4
5      type color_point
6          private
7              real :: x, y
8              integer :: color
9          end type color_point
10
11     interface                ! Interfaces for procedures with separate
12                             ! bodies in the submodule color_points_a
13     module subroutine color_point_del ( p ) ! Destroy a color_point object
14         type(color_point), allocatable :: p
15     end subroutine color_point_del
16     ! Distance between two color_point objects
17     real module function color_point_dist ( a, b )
18         type(color_point), intent(in) :: a, b
19     end function color_point_dist
20     module subroutine color_point_draw ( p ) ! Draw a color_point object
21         type(color_point), intent(in) :: p
22     end subroutine color_point_draw
23     module subroutine color_point_new ( p ) ! Create a color_point object
24         type(color_point), allocatable :: p
25     end subroutine color_point_new
26     end interface
27
28 end module color_points
    
```

29 The only entities within `color_points_a` that can be accessed by use association are separate module
 30 procedures for which corresponding module procedure interface bodies are provided in `color_points`.
 31 If the procedures are changed but their interfaces are not, the interface from program units that access
 32 them by use association is unchanged. If the module and submodule are in separate files, utilities that
 33 examine the time of modification of a file would notice that changes in the module could affect the
 34 translation of its submodules or of program units that access the module by use association, but that
 35 changes in submodules could not affect the translation of the parent module or program units that access
 36 it by use association.

37 The variable `instance_count` is not accessible by use association of `color_points`, but is accessible
 38 within `color_points_a`, and its submodules.

```

39     submodule ( color_points ) color_points_a ! Submodule of color_points
40
41         integer, save :: instance_count = 0
42
43         interface                ! Interface for a procedure with a separate
44                                 ! body in submodule color_points_b
45         module subroutine inquire_palette ( pt, pal )
46             use palette_stuff      ! palette_stuff, especially submodules
47                                 ! thereof, can access color_points by use
48                                 ! association without causing a circular
    
```

```

1           ! dependence because this use is not in the
2           ! module. Furthermore, changes in the module
3           ! palette_stuff are not accessible by use
4           ! association of color_points
5       type(color_point), intent(in) :: pt
6       type(palette), intent(out) :: pal
7       end subroutine inquire_palette
8
9       end interface
10
11 contains ! Invisible bodies for public module procedure interfaces
12         ! declared in the module
13
14       module subroutine color_point_del ( p )
15         type(color_point), allocatable :: p
16         instance_count = instance_count - 1
17         deallocate ( p )
18       end subroutine color_point_del
19       real module function color_point_dist ( a, b ) result ( dist )
20         type(color_point), intent(in) :: a, b
21         dist = sqrt( (b%x - a%x)**2 + (b%y - a%y)**2 )
22       end function color_point_dist
23       module subroutine color_point_new ( p )
24         type(color_point), allocatable :: p
25         instance_count = instance_count + 1
26         allocate ( p )
27       end subroutine color_point_new
28
29       end submodule color_points_a

```

30 The subroutine `inquire_palette` is accessible within `color_points_a` because its interface is declared
31 therein. It is not, however, accessible by use association, because its interface is not declared in the
32 module, `color_points`. Since the interface is not declared in the module, changes in the interface
33 cannot affect the translation of program units that access the module by use association.

```

34       submodule ( color_points_a ) color_points_b ! Subsidiary**2 submodule
35
36       contains
37         ! Invisible body for interface declared in the ancestor module
38       module subroutine color_point_draw ( p )
39         use palette_stuff, only: palette
40         type(color_point), intent(in) :: p
41         type(palette) :: MyPalette
42         ...; call inquire_palette ( p, MyPalette ); ...
43       end subroutine color_point_draw
44
45       ! Invisible body for interface declared in the parent submodule
46       module procedure inquire_palette
47         ... implementation of inquire_palette
48       end procedure inquire_palette
49
50       subroutine private_stuff ! not accessible from color_points_a
51         ...

```

```

1     end subroutine private_stuff
2
3     end submodule color_points_b
4
5     module palette_stuff
6         type :: palette ; ... ; end type palette
7     contains
8         subroutine test_palette ( p )
9             ! Draw a color wheel using procedures from the color_points module
10            type(palette), intent(in) :: p
11            use color_points ! This does not cause a circular dependency because
12                ! the "use palette_stuff" that is logically within
13                ! color_points is in the color_points_a submodule.
14            ...
15        end subroutine test_palette
16    end module palette_stuff

```

17 There is a use palette_stuff in color_points_a, and a use color_points in palette_stuff. The
18 use palette_stuff would cause a circular reference if it appeared in color_points. In this case, it
19 does not cause a circular dependence because it is in a submodule. Submodules are not accessible by use
20 association, and therefore what would be a circular appearance of use palette_stuff is not accessed.

```

21    program main
22        use color_points
23        ! "instance_count" and "inquire_palette" are not accessible here
24        ! because they are not declared in the "color_points" module.
25        ! "color_points_a" and "color_points_b" cannot be accessed by
26        ! use association.
27        interface draw                ! just to demonstrate it's possible
28            module procedure color_point_draw
29        end interface
30        type(color_point) :: C_1, C_2
31        real :: RC
32        ...
33        call color_point_new (c_1)      ! body in color_points_a, interface in color_points
34        ...
35        call draw (c_1)                ! body in color_points_b, specific interface
36                                       ! in color_points, generic interface here.
37        ...
38        rc = color_point_dist (c_1, c_2) ! body in color_points_a, interface in color_points
39        ...
40        call color_point_del (c_1)     ! body in color_points_a, interface in color_points
41        ...
42    end program main

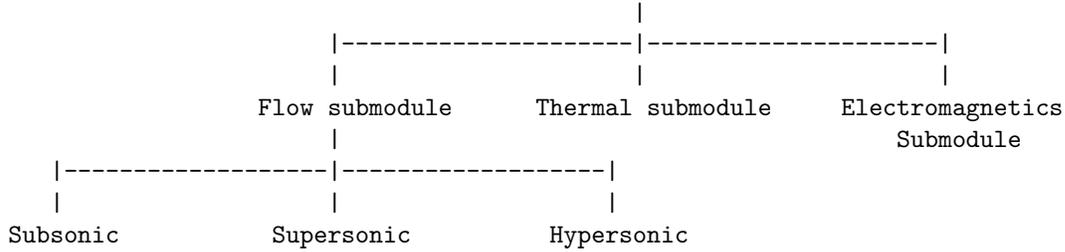

```

43 A multilevel submodule system can be used to package and organize a large and interconnected concept
44 without exposing entities of one subsystem to other subsystems.

45 Consider a Plasma module from a Tokamak simulator. A plasma simulation requires attention at least to
46 fluid flow, thermodynamics, and electromagnetism. Fluid flow simulation requires simulation of subsonic,
47 supersonic, and hypersonic flow. This problem decomposition can be reflected in the submodule structure
48 of the Plasma module:

49 Plasma module

1
2
3
4
5
6
7
8

9 Entities can be shared among the **Subsonic**, **Supersonic**, and **Hypersonic** submodules by putting
 10 them within the **Flow** submodule. One then need not worry about accidental use of these entities by
 11 use association or by the **Thermal** or **Electromagnetics** modules, or the development of a dependency
 12 of correct operation of those subsystems upon the representation of entities of the **Flow** subsystem as
 13 a consequence of maintenance. Since these these entities are not accessible by use association, if any
 14 of them are changed, it cannot affect program units that access the **Plasma** module by use association,
 15 and the answer to the question “where are these entities used” is confined to the set of descendant
 16 submodules of the **Flow** submodule.
