

Subject: General comments – for the editor
 From: Van Snyder

- 1 Page and line numbers here refer to 02-007, unless otherwise stated.
-
- 2 References to note numbers in 02-007 don't have the word "Note" or "note" before them. The
 3 first occurrence is at [47:9].
- 4 This could be fixed by finding every occurrence of "`\ref{N}`" and inserting "Note" or "note"
 5 before it. This allows to have different capitalization of "note" in different places, which may
 6 be viewed either as an advantage or a disadvantage.
- 7 Alternatively, the definition of the `\label` macro inside the `\note` macro in `j3.cls` (at line
 8 1460) could be changed to put `Note` or `note` before `\thenc` (which outputs the note counter).
 9 Originally, the `\thenc` macro output "Note" but this was deleted because it was used in the
 10 note heading, which was "NOTE" in the Frame edition, inadvertently resulting in not having
 11 "Note" in references. Putting "Note" in the `\label` macro is better than putting something in
 12 the `\thenc` macro (because it can be different), and it's less work than changing the text.
- 13 Editor's choice.
-
- 14 The *exp* at [217:5] is set with the `\emph` macro, instead of the `\st` macro. All of the other
 15 occurrences in Section 10 are set with `\st`. Again, Editor's choice whether to do anything.
-
- 16 The label for 13.4 Numeric models is "D13:Numeric manipulation and inquiry functions". You
 17 may want to change it to "D13:Numeric models" by using the `\divn` macro. But this requires
 18 tracking down the references and changing them. Again, Editor's choice whether to do anything.
-
- 19 The notes that begin with a `\label` have an extra space on their first line. See Note 4.20, e.g.
 20 Putting a % at the end of the `\label` should prevent this. Alternatively, the text could be
 21 started immediately after the `\label`, without any space, instead of on a new line.
-
- 22 Most attributes are put into the index under the "attribute, foobar" category. But "accessi-
 23 bility", "PRIVATE", "PUBLIC" and "SAVE" are put into the index as "attributes, foobar".
 24 Note plural number in the latter case. Editor's choice whether to do anything.
-
- 25 The index item for "arithmetic if" in `c08.tex` at line 1061 is misspelled.
-
- 26 The `\kw` macro (for keywords) sets its argument in `\ct` font. The editor has proposed to get
 27 rid of `\ct`, and just use `\cf` ("code font" – which is `\tt`) in its stead. Should keywords be set
 28 in `\tt` font, or something else?
-
- 29 The `cons` list environment isn't used anywhere – instead, the `dcons` macro is used. Maybe the
 30 `cons` list environment should be deleted from `j3.cls`.
-
- 31 The word `title` in a comment at line 1435 of `j3.cls` ought to be `label`.
-
- 32 Concerning 01-369r1, the editor remarks in 02-101 that tables 2.1 and 2.2 don't have labels.
 33 The `\jcaption` macro ought to generate a label consisting of T, followed by a colon, and then
 34 the caption.
