

Subject: Further extension to DOT\_PRODUCT  
 From: Van Snyder

1 **1 Introduction**

2 I occasionally need to compute (/ ( SUM(A(I,:)\*B(I,:), I = 1,N) /) and similarly for more factors. To  
 3 avoid an array temp if this is just the RHS of an assignment statement, or the need to write a loop, an  
 4 additional DOT\_PRODUCT would be useful.

5 **2 Requirement**

6 Provide syntactic sugar that allows to compute several inner products all at once.

7 **3 Detailed specification**

8 Provide another DOT\_PRODUCT function that has a DIMS argument and an indefinite number, but  
 9 at least two, of further arguments A1, A2, ... The DIMS argument is a rank-one integer array that  
 10 specifies the dimension of each of the other arrays over which the summation takes place. In the case  
 11 the  $A_n$  arguments are rank-two numeric arguments having the same shape, DOT\_PRODUCT( (/1,1/),  
 12 A1, A2 ) computes (/ ( SUM(A1(I,:)\*A2(I,:), I = 1, n ) /), with an obvious generalization for different  
 13 values of DIMS, different ranks, and more arguments. In the case of logical arguments, \* is replaced by  
 14 .AND. and SUM is replaced by ANY.

15 **4 Syntax**

16 No new syntax, and no changes to existing syntax.

17 **5 Edits**

18 Edits refer to 04-007. Page and line numbers are displayed in the margin. Absent other instructions, a  
 19 page and line number or line number range implies all of the indicated text is to be replaced by associated  
 20 text, while a page and line number followed by + (-) indicates that associated text is to be inserted after  
 21 (before) the indicated line. Remarks are noted in the margin, or appear between [ and ] in the text.

---

22 DOT\_PRODUCT ( DIMS, A1, A2, ... ) Multiple dot products of arrays with rank higher 297:2+  
 23 than one.

---

24 **13.7.32<sup>1</sup>/<sub>2</sub> DOT\_PRODUCT (DIMS, A1, A2 [ , A3, ... ] )** 314:1+

25 **Description.** Compute a generalization of multiple dot products of numeric or logical arrays.

26 **Class.** Transformational function.

27 **Arguments.**

28 DIMS Shall be a rank-one integer array with extent one less than the total number  
 of arguments of DOT\_PRODUCT.

29 A1 Shall be of numeric type (integer, real or complex) or of logical type.

30 A2 Shall be of numeric type if A1 is of numeric type and of logical type otherwise.

31 A3 ... (optional) Shall be of numeric type if A1 is of numeric type and of logical type otherwise.  
 There shall not be more than three arguments if A1 is of complex type.

32 None of the arguments shall be a scalar. At least one of A1, A2, ... shall have rank greater  
 33 than one. The value of DIMS(*i*) shall satisfy the inequality  $1 \leq \text{DIMS}(i) \leq \text{Rank of } A_i$ . The  
 34 DIMS(*i*) dimensions of  $A_i$  shall all have the same extents. The arrays that result by suppressing  
 35 the DIMS(*i*) dimensions of  $A_i$  that are not rank-one arrays shall all have the same shapes.

36 **Result Characteristics.** If the arguments are of numeric type, the type and kind type pa-  
 37 rameter of the result are those of the expression  $E1 * E2 * \dots$ , where E1, E2, ... are scalars of

1 the same type and kind type parameters as A1, A2, ..., respectively, according to 7.1.4.2. If  
 2 the arguments are of logical type, the type of the result is logical and the kind type parameter  
 3 of the result is that of E1 .AND. E2 .AND. ..., where E1, E2, ... are logical scalars of the same  
 4 kind type parameters as A1, A2, ..., respectively, according to 7.1.4.2. The shape of the result  
 5 is the shape of the array that results by suppressing dimension DIMS(*i*) of A<sub>*i*</sub>, where A<sub>*i*</sub> is an  
 6 argument having rank greater than one.

7 **Result Value.**

8 *Case (i):* If A1 is of real or integer type the (*i*<sub>1</sub>, *i*<sub>2</sub>, ..., *i*<sub>*k*</sub>) element of the result has the  
 9 value SUM(A1(*i*<sub>1</sub>, ..., *i*<sub>DIMS(1)-1</sub>, :, *i*<sub>DIMS(1)+1</sub>, ..., *i*<sub>*k*</sub>) \* A2(*i*<sub>1</sub>, ..., *i*<sub>DIMS(2)-1</sub>,  
 10 :, *i*<sub>DIMS(2)+1</sub>, *i*<sub>*k*</sub>) \* ...), where the (*i*<sub>1</sub>, *i*<sub>2</sub>, ..., *i*<sub>*k*</sub>) subscripts are suppressed for  
 11 arguments of rank one.

12 *Case (ii):* If A1 is of complex type the (*i*<sub>1</sub>, *i*<sub>2</sub>, ..., *i*<sub>*k*</sub>) element of the result has the value  
 13 SUM(CONJG(A1(*i*<sub>1</sub>, ..., *i*<sub>DIMS(1)-1</sub>, :, *i*<sub>DIMS(1)+1</sub>, ..., *i*<sub>*k*</sub>)) \* A2(*i*<sub>1</sub>, ..., *i*<sub>DIMS(2)-1</sub>,  
 14 :, *i*<sub>DIMS(2)+1</sub>, *i*<sub>*k*</sub>)), where the (*i*<sub>1</sub>, *i*<sub>2</sub>, ..., *i*<sub>*k*</sub>) subscripts are suppressed for argu-  
 15 ments of rank one..

16 *Case (iii):* If A1 is of logical type the (*i*<sub>1</sub>, *i*<sub>2</sub>, ..., *i*<sub>*k*</sub>) element of the result has the value  
 17 ANY(A1(*i*<sub>1</sub>, ..., *i*<sub>DIMS(1)-1</sub>, :, *i*<sub>DIMS(1)+1</sub>, ..., *i*<sub>*k*</sub>) .AND. A2(*i*<sub>1</sub>, ..., *i*<sub>DIMS(2)-1</sub>,  
 18 :, *i*<sub>DIMS(2)+1</sub>, *i*<sub>*k*</sub>) .AND. ...), where the (*i*<sub>1</sub>, *i*<sub>2</sub>, ..., *i*<sub>*k*</sub>) subscripts are suppressed  
 19 for arguments of rank one.

20 **Example.** Let A1 be the array  $\begin{bmatrix} A & B & C \\ D & E & F \end{bmatrix}$ , A2 be the array  $[ G \quad H \quad J ]$ , and A3 be the

array  $\begin{bmatrix} K & L \\ M & N \\ P & Q \end{bmatrix}$ . Then DOT\_PRODUCT ( (/ 2, 1, 1 /), A1, A2, A3 ) has the value  $[ A*G*K$   
 21  $+ B*H*M + C*J*P, D*G*L + E*H*N + F*J*Q ]$ .
